

Pressure Treatments

Low Pressure

UC1

Suitable for dry internal timbers that may suffer from insect damage, such as floor joists and truss rafters.

UC2

Suitable for internal timber that may be more susceptible to wetting, such as tile battens and CLS framing.

High Pressure

UC3A

Suitable for outdoor use and above ground use as the timber is coated at this level.

UC3B

Uncoated – this is suitable for external timber that remains above ground, such as fence rails.

UC4

Any timber that comes in contact with water or direct soil must be treated to this level. Including fence posts and decking structures sunk in the ground.
